

US Crude & Distillate -- Weekly S/D Monitor

Week ending 2026-06-26 | EIA Weekly Petroleum Status Report | Generated from SYNTHETIC sample data -- illustrative output only. Connect a live EIA API key for the real current view.

Inventory snapshot vs 5-year seasonal norm

	level (Mb)	5-yr avg (Mb)	vs 5-yr avg (Mb)	vs 5-yr avg (%)	pos in 5-yr range	WoW D (Mb)	4-wk D (Mb)	vs yr-ago (Mb)
Crude (comm., ex-SPR)	409.0	439.9	-30.9	-7.0	-0.1	-2.0	-17.4	-24.3
Cushing	18.6	30.9	-12.3	-39.8	-0.1	-0.4	-0.4	-3.6
Distillate	107.4	117.5	-10.1	-8.6	0.2	0.6	3.5	-0.4

Crude

Commercial crude stocks are 409 Mb, 31 Mb (7%) below the 5-yr seasonal average and below the bottom of its 5-yr range. The last 4 weeks drew 17 Mb. The baseline projection has the deficit at 40 Mb by 2026-09-18 (widening). Cushing sits at 18.6 Mb, below the bottom of its 5-yr range (-40% vs 5-yr avg) -- the WTI delivery point is critically thin.

Distillate

Distillate stocks are 107 Mb, 10 Mb (9%) below the 5-yr average, in the bottom quartile of its 5-yr range. 4-wk change: +4 Mb. Baseline projection puts the gap at -10 Mb vs norm by 2026-09-18, i.e. still well short of normal ahead of the winter heating season.

View

MODEL VIEW: crude TIGHT (supportive of flat price and backwardated WTI structure); distillate TIGHT (constructive for diesel cracks and HO spreads).

Method: weekly EIA balance (Supply - Demand = DInventory), inventory level vs trailing 5-yr seasonal average, 12-week flow-based projection. Balance residual is tracked as a data-quality check only.
